Diagnostic Report

Diagnosis Summary:

Primary Diagnosis: Acute Appendicitis

On the date of the visit, 2023-09-15, Mr. Johnathan Archer reported to the emergency department with acute abdominal pain, nausea, and vomiting. A physical examination revealed tenderness in the lower right quadrant of the abdomen. A CT scan was performed, confirming the diagnosis of acute appendicitis. Blood work showed elevated white blood cell counts, indicative of infection.

Mr. Archer does not present a history of previous abdominal surgeries, and he reports no significant medical history besides his known allergy to penicillin.

Treatment Plan

Treatment Strategy:

Upon confirmation of the diagnosis of acute appendicitis, an urgent laparoscopic appendectomy was performed by Dr. Elisa Taylor. The surgery was uneventful, and all inflamed appendiceal tissue was successfully removed.

Post-operative care included administration of intravenous fluids, pain management using acetaminophen, avoiding penicillin-based antibiotics due to Mr. Archer's allergy, and a regimen of broad-spectrum antibiotics.

Mr. Archer was monitored overnight for signs of infection or complications, and instructions were provided for home care including dietary restrictions and activity limitations.

Prescription and Medications

Prescribed Medications:

1. Acetaminophen 500mg, every 6 hours as needed for pain
2. Cephalexin 500mg, twice daily for 7 days to prevent infection

It was noted that due to Mr. Johnathan Archer's known allergy to penicillin, an alternative antibiotic regimen was selected to avoid adverse reactions.

Follow-up Recommendations

Follow-up Schedule:

Mr. Archer is advised to schedule a follow-up appointment within two weeks post-operation, on approximately the 29th of September 2023, with Dr. Elisa Taylor. During this appointment, suture inspection, removal, and evaluation of healing progress will occur.

Additionally, Mr. Archer should monitor for any signs of infection at the surgical site, such as redness, swelling, or discharge, and report these symptoms immediately to avoid complications.
